

ADVANCED ECONOMETRIC THEORY
EXERCISES 10
TESTS BASED ON LIKELIHOOD FUNCTIONS

Reference: Gouriéroux and Monfort (1995, Chapter 17)

1. Explain in an intuitive way the principles underlying the following tests: Wald test, Rao score test, likelihood ratio, Neyman's $C(\alpha)$, and Hausman test.
2. Let (Y_i, X_i) , $i = 1, \dots, n$, be observations such that the conditional likelihood of $Y = (Y_1, \dots, Y_n)$ given $X = (X_1, \dots, X_n)'$ has the form:

$$L_n(\theta) = \prod_{i=1}^n f(y_i | x_i, \theta)$$

where θ is a $p \times 1$ parameter vector. Further, suppose the regularity conditions of Property 7.17 of Gouriéroux and Monfort (1995, Chapter 7, Section 7.4) are satisfied. We consider an implicit hypothesis $H_0 : g(\theta) = 0$, where $g(\theta)$ is an $r \times 1$ vector such that the matrix $\partial g / \partial \theta'$ has rank r ($1 \leq r \leq p$).

- (a) Derive the asymptotic distribution (under H_0) of the Wald statistic for testing H_0 .
 - (b) Show that this test is consistent.
3. Under the conditions of question 2,
 - (a) describe Rao's score statistic for testing H_0 , and show it is identical to the Lagrange multiplier statistic;
 - (b) derive the asymptotic distribution of the score statistic;
 - (c) show that the score statistic is asymptotically equivalent to the Wald statistic (under H_0);
 - (d) give a sufficient condition under which the score test is consistent.

4. Under the conditions of question 2, show that the Wald, Rao score and likelihood ratio statistics are asymptotically equivalent under H_0 .
5. Under the conditions of question 2, for an hypothesis of the type $H_0 : \theta_1 = \theta_1^0$, where $\theta = (\theta'_1, \theta'_2)'$ and θ_i is a $p_i \times 1$ vector ($i = 1, 2$),
 - (a) describe Neyman's $C(\alpha)$ statistic for testing H_0 ;
 - (b) show that this statistic is asymptotically equivalent (under H_0) to the Wald statistic, and derive the asymptotic of the $C(\alpha)$ statistic under H_0 ;
 - (c) describe how a $C(\alpha)$ test can be implemented through an artificial regression.
